Week 8 – Wireframes

Gliffy (<https://www.gliffy.com/>)

Gliffy is a HTML5 diagramming software that allows users to drag and drop various shapes onto a blank template. These shapes can then be customized to whatever dimensions, color, or orientation the user desires. What makes Gliffy special is its capability for real-time collaboration. Users can simultaneously design and edit a project within a shared environment.

Balsamiq (<https://balsamiq.com/>)

Balsamiq is another wireframing/mockup tool meant to allow users to quickly develop designs so that they may get back to the drawing board for improvements. Balsamiq seems to be more in-depth compared to Gliffy, with a wider selection of pre-designed widgets for designers to play with. The style of the tool matches the idea that it's meant for brainstorming with widgets and text having a hand-drawn look.
